

# README

This repository contains the reproducible workflow of the paper *Fourteen years of continuous soil moisture records from plant and biocrust-dominated microsites* (Moreno *et al.*, under review).

The workflow is available as an interactive Rstudio notebook in the file `moiscrust.Rmd` stored in this repository. It is packaged with `renv` to facilitate reproducibility. To run it in your computer, execute the code chunk below in your R session once you have `moiscrust.Rmd` opened in Rstudio. This code chunk is also available at the beginning of the notebook.

```
install.packages("renv")
renv::restore()
```

Once the `renv` environment is restored, the code chunks in the document can be executed once by one, or all at once with the option `Restart R and Run All Chunks` in the `Run` button.
